

Dear Homeowner,

As the seasons change, it's important to ensure your air conditioning system is ready for the warmer months. Here are some preparation tips to keep your home cool and your system running efficiently:

1. Schedule a Professional Maintenance Check

It's recommended to have your air conditioning unit serviced by a professional at least once a year. This helps identify any potential issues before they become major problems.

2. Change the Air Filter

Check and replace the air filter if necessary. A clean filter improves airflow and efficiency.

3. Clear the Outdoor Unit

Remove any debris, leaves, or obstructions around your outdoor condenser unit to ensure proper airflow.

4. Check Insulation and Seals

Inspect your ductwork for any leaks and ensure that all insulation is intact. Sealing leaks can greatly improve efficiency.

5. Test Your System

Turn on your air conditioning system and let it run for a while. Listen for any unusual noises and check for cool air flow.

6. Plan for Emergency Repairs

Prepare for potential emergency repairs by having a reliable HVAC technician on hand.

Taking these steps now can help ensure that you and your family stay comfortable during the hot months ahead. If you have any questions or need assistance, feel free to reach out.

Best Regards,

Your HVAC Service Team
